Experience

Frontend Developer – JKstack Technologies | [June 2025 – Current]

Client: Royal Bank of Canada

- Contributed to front-end development for RBC mortgage applications using **Angular** and reusable component-based architecture.
- Assisted in Angular version migration activities (**Angular 15 – Angular 19**), supporting refactoring and compatibility updates across modules.
- Developed and enhanced web applications built on **service-oriented, HTTP/REST-based architectures**, integrating frontend features with backend APIs to support business workflows.
- Built and maintained **Angular frontend components** with a focus on reusability, maintainability, and performance within large-scale enterprise applications.
- Consumed and integrated **RESTful APIs**, handling request/response lifecycles, error states, and data validation across application features.
- Worked within systems backed by **microservices-based architectures**, focusing on application-level development while interacting with independently deployed services.
- Supported applications deployed in **cloud-hosted environments**, working across development, staging, and production setups in collaboration with platform teams.
- Leveraged **RxJS** for asynchronous and reactive data handling, using operators such as map, filter, switchMap, and concatMap to manage API responses and UI state.
- Contributed to building **reliable and scalable solutions** by adhering to coding standards, refactoring existing components, and improving overall application stability.
- Used **Git and modern development tools** to manage version control, feature branches, and collaborative development workflows.
- Wrote and maintained **unit tests**, supporting regression prevention and ensuring consistent behavior across releases.
- Collaborated closely with **product owners, developers, and QA teams** in an Agile environment to translate requirements into production-ready software.

Software Engineer Internship – JKstack Technologies | [May –August 2024]

- Improved website responsiveness and UI consistency across major browsers.
- Maintained and updated existing Angular-based websites for client needs.
- Developed new frontend features and full pages for collaborative customer platforms.
- Built a full-featured business website for a local client in collaboration.

Education

B.S. IN COMPUTER SCIENCE (4 YEAR PROGRAM & SPECIALIZATION) | UNIVERSITY OF WESTERN ONTARIO, LONDON | 2021 – 2025

- DEAN'S HONOR LIST IN THE ACADEMIC YEAR (2023 – 2024) & (2024 – 2025) | (3rd & 4th Year)

COURSES: Introduction to Software Engineering | Introduction to Artificial Intelligence | Data Structures & Algorithms | Operating Systems | Software Specification, Testing and Quality Assurance | Computer Graphics 1 | Object-Oriented Design & Analysis | Scalable and Robust Distributed Systems | Software Project Management | Databases 1.

Technical Skills

- Languages: Java, JavaScript, Typescript, C, Python, HTML5, CSS, MySQL
- Frameworks: Angular, React, Bootstrap, Node.js, Express, Spring Boot, Firebase
- Development Tools: Git, Visual Studio Code, Docker, JIRA, Figma, IntelliJ, Eclipse

Projects

Group Task Manager
Live Demo: https://ng-deployment-final.web.app

- A collaborative task management web application that I developed for fun while learning which allows users to **create, manage, and complete tasks within a group using Angular**. Designed to streamline teamwork by keeping shared tasks organized and up to date.

Pickodex – Personal Project

Angular, TypeScript, RxJS, REST APIs, Node.js / Express

- Built a service-oriented Angular web application as a personal project to experiment with application architecture and play prediction-style games with friends.
- Designed the frontend to consume RESTful APIs through a dedicated service layer, supporting persistence and retrieval of user submissions without tightly coupling UI logic to the backend.
- Implemented HTTP-driven workflows (GET/POST) for prediction and results flows (e.g., IPL and NFL), handling asynchronous responses, loading states, and error scenarios using RxJS.
- Structured the application with a clear separation of concerns between UI components, state handling, and data access logic, allowing the backend to be easily mocked or swapped.
- Developed reusable ranking and results components that could be shared across multiple domains (sports and entertainment) using consistent REST API contracts.

PyGame based on RAFT Algorithm Simulation

- A project for university course I'm proud of where we went beyond minimum requirements to show RAFT simulation.
- Built an interactive PyGame simulation of the Raft consensus algorithm, gamifying distributed systems concepts by visualizing leader election and fault tolerance.

- Implemented state transitions (leader, follower, candidate) and quorum-based majority rules, showing how system failures prevent consensus when >50% of nodes are down.
- Designed maintainable Python code to make distributed systems theory more accessible through visualization.
